Atty. Docket: Q87339

AMENDMENTS TO THE CLAIMS

1. (Currently Amended): A wheel bearing unit according to claim 9, that includes a stationary ring that has a stationary raceway on a stationary peripheral surface and is not rotated in operation, a rotary ring that has a rotary raceway on a rotary peripheral surface and is rotated in operation, a plurality of rolling elements provided between the stationary raceway and the rotary raceway, and a rotary flange provided to an outer peripheral surface of the rotary ring, and couples/supports a braking rotating body having a braking friction surface against which a friction material is pushed in a braking operation onto a side surface of the rotary flange at least in operation, comprising:

an encoder which is fixed to a part of the rotary ring and at least a part of which is made of a permanent magnet;

wherein the processed portion of the wheel bearing is the side surface of the rotary flange is processed into predetermined shape and dimension while rotating the rotary ring around the stationary ring in a state that the stationary ring, the rotary ring, and the plurality of rolling elements are assembled together and also a space in which the encoder is provided is isolated from an outside by fitting a stop plug or a cover to a part of the stationary ring or the rotary ring directly or via other member, and

the stop plug or the cover is removed from the stationary ring or the rotary ring after the side surface of the rotary flange is processed into predetermined shape and dimension but before the wheel bearing unit is fitted to a suspension system.

2. (Currently Amended): A wheel bearing unit according to claim 9, that includes a stationary ring that has a stationary raceway on a stationary peripheral surface and is not rotated in operation, a rotary ring that has a rotary raceway on a rotary peripheral surface and is rotated in operation, a plurality of rolling elements provided between the stationary raceway and the rotary raceway, and a rotary flange provided to an outer peripheral surface of the rotary ring, and couples/supports a braking rotating body having a braking friction surface against which a friction material is pushed in a braking operation onto a side surface of the rotary flange at least in operation, comprising:

an encoder which is fixed to a part of the rotary ring and at least a part of which is made of a permanent magnet;

wherein the processed portion of the wheel bearing unit is the braking friction surface of the braking rotating body is processed into predetermined shape and dimension while rotating the rotary ring that couples/supports the braking rotating body around the stationary ring in a state that the stationary ring, the rotary ring, and the plurality of rolling elements are assembled together and also a space in which the encoder is provided is isolated from an outside by fitting a stop plug or a cover to a part of the stationary ring or the rotary ring directly or via other member, and

the stop plug or the cover is removed from the stationary ring or the rotary ring after the braking friction surface is processed into predetermined shape and dimension but before the wheel bearing unit is fitted to a suspension system.

3. (Previously Presented): A wheel bearing unit according to claim 1, wherein the stationary ring is an outer ring that has an outer ring raceway as the stationary raceway on an inner peripheral surface as the stationary peripheral surface, and the rotary ring is a rotating member that is arranged on an inner diameter side of the outer ring and has an inner ring raceway as the rotary raceway on an outer peripheral surface as the rotary peripheral surface.

SECOND Preliminary Amendment US Appln. 10/531,702

unit is fitted to the suspension system.

4. (Original): A method of manufacturing a wheel bearing unit set forth in claim 1, in which the side surface of the rotary flange is processed into predetermined shape and dimension while rotating the rotary ring around the stationary ring in the state that the stationary ring, the rotary ring, and the plurality of rolling elements are assembled together and also the space in which the encoder is provided is isolated from the outside by fitting the stop plug or the cover to the part of the stationary ring or the rotary ring directly or via other member, and then the stop plug or the cover is removed from the stationary ring or the rotary ring before the wheel bearing

Atty. Docket: Q87339

5. (Currently Amended): A method of manufacturing a wheel bearing unit set forth in claim 2, in which the braking friction surface of the braking rotating body is processed into predetermined shape and dimension while rotating the rotary ring that couples/supports the braking rotating body around the stationary ring in a state that the stationary ring, the rotary ring, and the plurality of rolling elements are assembled together and also the space in which the encoder is provided is isolated from the outside by fitting the stop plug or the cover to the part of the stationary ring or the rotary ring directly or via other member, and then the stop plug or the cover is removed from the stationary ring or the rotary ring before the wheel bearing unit is fitted to the suspension system.

SECOND Preliminary Amendment Atty. Docket: Q87339 US Appln. 10/531,702

claim 3, in which the side surface of the rotary flange provided to an outer peripheral surface of

6. (Previously Presented): A method of manufacturing a wheel bearing unit set forth in

the rotating member is processed into predetermined shape and dimension while rotating the

rotating member around the outer ring in the state that the outer ring, the rotating member, and

the plurality of rolling elements are assembled together and also the space in which the encoder

is provided is isolated from the outside by fitting the stop plug or the cover to the part of the

outer ring or the rotating member directly or via other member, and then the stop plug or the

cover is removed from the outer ring or the rotating member before the wheel bearing unit is

fitted to the suspension system.

7. (Previously Presented): A wheel bearing unit according to claim 2, wherein the

stationary ring is an outer ring that has an outer ring raceway as the stationary raceway on an

inner peripheral surface as the stationary peripheral surface, and the rotary ring is a rotating

member that is arranged on an inner diameter side of the outer ring and has an inner ring raceway

as the rotary raceway on an outer peripheral surface as the rotary peripheral surface.

8. (Currently Amended): A method of manufacturing a wheel bearing unit set forth in

claim 7, in which the braking friction surface of the braking rotating body that is

coupled/supported to the rotating member is processed into predetermined shape and dimension

while rotating the rotating member around the outer ring in the state that the outer ring, the

rotating member, and the plurality of rolling elements are assembled together and also the space

in which the encoder is provided is isolated from the outside by fitting the stop plug or the cover

to the part of the outer ring or the rotating member directly or via other member, and then the

stop plug or the cover is removed from the outer ring or the rotating member before the wheel

bearing unit is fitted to the suspension system.

5

US Appln. 10/531,702

9. (New) A wheel bearing unit that includes a stationary ring that has a stationary raceway on a stationary peripheral surface and is not rotated in operation, a rotary ring that has a rotary raceway on a rotary peripheral surface and is rotated in operation, a plurality of rolling elements provided between the stationary raceway and the rotary raceway, and a rotary flange provided to an outer peripheral surface of the rotary ring, wherein said rotary flange couples/supports a braking rotating body having a braking friction surface against which a friction material is pushed in a braking operation onto a side surface of the rotary flange at least in operation, comprising:

an encoder which is fixed to a part of the rotary ring and at least a part of which is made of a permanent magnet; and

a processed portion of the wheel bearing unit that is processed into predetermined shape and dimension in a state that the stationary ring, the rotary ring, and the plurality of rolling elements are assembled together and also a space in which the encoder is provided is isolated from an outside by fitting a stop plug or a cover to a part of the stationary ring or the rotary ring directly or via other member, and

the stop plug or the cover is removed from the stationary ring or the rotary ring after the portion of the wheel bearing unit is processed into predetermined shape and dimension but before the wheel bearing unit is fitted to a suspension system.
